

***Industrial Safety and Health Management 7th edition
Asfahl Solutions Manual***

SKU: 9780134630564-SOLUTIONS

CHAPTER 1 SOLUTIONS TO END-OF-CHAPTER EXERCISES

- 1.1. Some standards are frequently cited because these standards cover (1) areas in which industries are having difficulty complying, or (2) areas in which enforcement agencies are giving a great deal of attention, or both.
- 1.2. Many aspects about the standards might be useful. The text emphasizes the importance of the "why" behind the standards that do exist.
- 1.3. No. It is an unattainable goal. Such a strategy fails to recognize the need for discrimination among hazards to be corrected.
- 1.4. (1) Hazards that are physically infeasible to correct.
(2) Hazards that are physically feasible, but are economically infeasible, to correct.
(3) Hazards that are physically feasible and economically feasible to correct.
- 1.5. (1) Causes other more serious hazards to be overlooked while reacting to less serious ones.
(2) Deteriorates credibility with top management.
- 1.6. A safety hazard is acute, causes or threatens to cause injuries, and is usually more obvious than a health hazard.
A health hazard is chronic, causes or threatens to cause illness in the long run, and is usually more subtle than a safety hazard.
- 1.7. Some example safety hazards:
unguarded belts, pulleys, gears, saws, and punch presses; fires; explosions; open platforms; defective ladders; welding near open flammable or combustible materials; overloaded or defective cranes, hoists, or slings; ungrounded electrical equipment; exposed live electrical conductors.
Some example health hazards:
coal dust, cotton dust, chronic loud noise, welding fumes, asbestos, vinyl chloride, lead fumes, mercury, manganese, cadmium.
- 1.8. Some valid examples are spray paint, coal dust, benzene, and carbon disulfide.
- 1.9. Some valid examples are noise, welding, and radiation.
- 1.10. Health hazards are usually more subtle than safety hazards; the industrial hygienist must look for "unseen" hazards.
- 1.11. Safety hazards may appear more grave, but there are probably many health hazard-related illnesses and deaths which are not documented.
- 1.12. Work training, statistics, job placement, industrial relations.
- 1.13. A comprehensive safety and health program involves engineering, and placement of the function within the personnel department may restrict authority too much.
- 1.14. This places the Safety and Health Manager in an adversarial position with enforcement officials.
- 1.15. CPSC concentrates on the responsibility of the manufacturers of the machines and equipment, whereas OSHA concentrates on the responsibility of the employer who places the equipment into use in the workplace.
- 1.16. (NSC) National Safety Council
- 1.17. ANSI (American National Standards Institute)
Prepares voluntary standards for occupational safety and health among other types of standards. OSHA adopted many ANSI standards early on, invoking its temporary right to promulgate "national consensus standards."

- 1.18. OSHA is concerned with hazardous exposures to workers, i.e. worker safety and health.
EPA is concerned with hazardous exposures to the public, particularly as these hazards affect the earth, water, and atmosphere.
Many safety and health hazards inside the plant and outside are the same, or are caused by the same chemical agents or physical factors. Thus a firm's compliance with both EPA and OSHA regulations are often the responsibility of the same individual.
- 1.19. 1-800-CDC-INFO; the agency that responds is, obviously, NIOSH, the National Institute for Occupational Safety and Health.
- 1.20. Passage of The Occupational Safety and Health Act of 1970, which created the Occupational Safety and Health Administration (OSHA).
- 1.21. Prior to passage of the OSHA law occupational health seemed remote and not of a great deal of concern. Plant nurses were concerned with first aid and physical examinations. After OSHA, occupational disease prevention rose in importance.
- 1.22 The Bhopal, India disaster in which the release of methyl isocyanate gas killed 2500 civilians. This incident showed that dangerous working conditions do not just impact the workers, but everyone around a facility.
- 1.23 Reductions in energy consumption, for example, can lower a firm's bottom line energy cost while decreasing its impact on the environment.
- 1.24 The four environmental issues addresses were global warming, green engineering, petroleum conservation, and tobacco smoke.
- 1.25 Green engineering is focused on the reduction of carbon fuels, which in turn directly impact global warming.
- 1.26 Systems Safety is considered essential in airlines, aerospace, and hospitals. These are industries in which the failure of a system can be catastrophic.
- 1.27 Systems Safety recognizes the benefit of such life-cycle planning and design, and the System Safety Society is one of the societies dedicated to the movement.
- 1.28 A chronic effect is a long-term deterioration due to prolonged exposure whereas an acute effect is a sudden reaction to a severe condition.
- 1.29 A safety hazard would be a sudden exposure to sound loud enough to damage hearing with one exposure. A health hazard would be continued long-term exposure to sound above the PEL which could lead to damage over a course of time.
- 1.30 The effects of occupational health fatalities are often delayed whereas occupational safety fatalities generally occur immediately.
- 1.31 The national trade associations
- 1.32 The primary purpose of such materials is to promote the industry products.
- 1.33 NIOSH
- 1.34 OSHA itself
- 1.35 ANSI and NFPA
- 1.36 Fear of triggering an inspection. For that reason OSHA allows questions to be posed in a hypothetical format.
- 1.37 The aerospace industry
- 1.38 The Systems Safety Society

CHAPTER 2 SOLUTIONS TO END-OF-CHAPTER EXERCISES

- 2.1. The achievement of worker safety lies principally in the hands of the workers themselves and their direct supervisors; thus it is principally a line function. Safety and health managers, however, are staff positions.
- 2.2. Acting as a facilitator in assisting, motivating, and advising the line function in achieving worker safety and health.
- 2.3. They too often are such emotional crusaders for the cause that they lose their credibility and with it their eligibility to be considered a "manager."
- 2.4. That safety must be achieved by line personnel facilitated by the staff function.
- 2.5. Go to top management to re-determine its level of commitment to safety and health.
- 2.6. The workers compensation system is a state, not federal system. The system is nearly 100 years old; the first workers compensation laws were introduced into state legislatures in 1909.
- 2.7. The ostensible purpose is to protect the worker by providing statutory compensation levels to be paid by the employer for various injuries that may be incurred by the worker.
An ulterior feature is immunity from additional liability for the employer, except where "gross negligence" can be proven.
- 2.8. Management contends that some risk is inescapable in any line of work. Therefore, their answer to the question is no. The worker bears some of the risk in return for his/her pay for the job.
- 2.9. The employer or the employer's insurance carrier.
- 2.10. An industrial safety consultant employed by an insurance company. The consultant's objective is to keep claims low among clients of his insurance company.
- 2.11. A standardized recordkeeping system for industrial safety established by the National Safety Council and later superseded by OSHA's system of recordkeeping.
- 2.12. Differences in recordkeeping requirements for OSHA and its predecessor Z16.1 system. Other variations in conditions, such as employment levels and recession cycles impact recordkeeping.
- 2.13. The "lost workdays" method would not reveal some very serious accidents, especially fatalities, that do not cause a loss of a workday.
- 2.14. One that is work-related and requires medical treatment.
- 2.15.
$$\frac{22 \times 200,000}{150 \times 40 \times 50} = \frac{44}{3} = 14.67$$
- 2.16. The injury/illness incidence rate computation prescribed by OSHA relates to 200,000 work-hours (roughly one year for a 100-employee firm), whereas the traditional frequency rate relates to 1,000,000 work-hours (roughly one year for a 500 employee firm). Also the OSHA injury/illness incidence rate applies to all work-related injuries/illnesses which require medical treatment, whereas the traditional frequency rate related only to "lost-time" cases.
- 2.17. Frequency measures the numbers of cases per standard quantity of work-hours.
Severity measures the total impact of cases in terms of total "lost workdays" per standard quantity of workhours.
Seriousness is the ratio of severity to frequency and measures the average seriousness of all cases.
All three are obsolete terms now.

- 2.18. OSHA Form 300a, the annual "Summary of Work-Related Injuries and Illnesses" must be posted on February 1 each year and remain posted until April 30.
- 2.19. For general records: 5 years (Chapter 5 will reveal longer retention requirements for certain records.)
- 2.20. Yes; they can help to discover hazards, but they can also dilute responsibility for workplace safety and health and can degenerate into spy parties. Without adequate orientation, safety and health committees can often become unreasonable.
- 2.21. Direct costs are the "tip of the iceberg" compared to indirect costs.
- 2.22. (1) Costs of wages paid for time lost by workers who were not injured.
 (2) Cost of damage to material or equipment.
 (3) Cost of wages paid for time lost by the injured worker.
 (4) Extra cost of overtime work necessitated by the accident.
 (5) Cost of wages paid supervisors for time required for activities necessitated by the accident.
 (6) Wage cost caused by decreased output of injured worker after return to work.
 (7) Cost of learning period of new worker.
 (8) Uninsured medical cost borne by the company.
 (9) Cost of time spent by higher supervision and clerical workers.
 (10) Miscellaneous costs such as public liability claims, rental equipment, and lost sales.
- 2.23. Noninjury accidents are usually caused by the same types of conditions and practices that result in injury accidents.
- 2.24. First-line supervisors
- 2.25. A six-month work period = 1000 hours.
 (a) General injury/illness rate = $\frac{15 \times 200,000}{40 \times 1,000} = \frac{3,000,000}{40,000} = 75$
 (b) Traditional frequency rate = $\frac{4 \times 200,000}{40 \times 1,000} = \frac{800,000}{40,000} = 20$
- 2.26. Total Injury Incident Rate $\frac{(3+1) \times 200,000}{30 \times 2,000} = \frac{800,000}{60,000} = 13.33$
 LWDI $\frac{1 \times 200,000}{30 \times 2,000} = \frac{200,000}{60,000} = 3.33$
- 2.27. (a) Total incidence rate = $\frac{(3+1+1+1) \times 200,000}{62 \times 2000}$
 = 11.29
 (b) (According to current OSHA recordkeeping policy, count calendar days, not just workweek days, i.e. 7 days/wk, not 5 days/wk)
 Number-of-lost-workdays rate = $\frac{(7+7+42) \times 200,000}{62 \times 2000}$
 = 90.3
 (c) LWDI = $\frac{1 \times 200,000}{62 \times 2000} = \underline{1.6}$
 (excludes illnesses and all fatalities)
- 2.28. The 12 first-aid cases are non-recordable. The two illnesses do not enter into the calculation of the LWDI, but the lost-time injuries would. Therefore, the LWDI would be calculated as:

$$\text{LWDI} = \frac{3 \times 200,000}{62 \times 2000} = 6.67 \text{ for the 4-month period}$$

$$135 \times (4/12) \times 2000$$

Since $6.67 > 3.6$, this would indicate that improvement is needed to meet the objective. However, if no more lost time injuries occurred for the year (an unlikely outcome):

$$LWDI = \frac{3 \times 200,000}{135 \times 2000} = \frac{300}{135} = 2.22$$

and the objective LWDI of 3.6 would easily be met.

- 2.29. The classification of the 12 accident files in this case study is subject to some variation due to individual judgment. This analysis will assume the following classification:

Columns on the OSHA 300 Log

File		G	H	I	J	K	L	M1	M2	M3	M4	M5	M6
1	not recordable												
2			X			14							X
3	not recordable												
4			X			7	28		X				
5					X			X					
6					X			X					
7	not recordable												
8					X				X				
9			X			14					X		
10	not recordable												
11		X						X					
12			X			3	42	X					
Column Totals:		1	4	0	3	38	70	4	2	0	1	0	1

$$(a) \text{ LWDI} = \frac{3 \times 200,000}{900 \times 2000} = \frac{1}{3} = .33$$

(The LWDI excludes fatalities, excludes illnesses, and includes all "lost-time" injuries, including those injuries in which the worker has "restricted work activity days," i.e. is temporarily transferred to another job, even if there are no days away from work.)

$$\text{Total Injury rate (excluding fatalities)} = \frac{(4 - 1) \times 200,000}{900 \times 2000} = \frac{3}{9} = .33$$

$$\text{Total Illness rate} = \frac{(2+0+1+1) \times 200,000}{900 \times 2000} = \frac{4}{9} = .44$$

$$\text{Fatality rate} = \frac{1 \times 200,000}{900 \times 2000} = \frac{1}{9} = .11$$

$$\begin{aligned} \text{Number-of-lost-workdays rate} &= \frac{(70 + 38) \times 200,000}{900 \times 2000} \\ &= 108/9 = 12 \end{aligned}$$

$$\begin{aligned} \text{Specific hazard incidence rate (fractures)} &= \frac{(1 + 1) \times 200,000}{900 \times 2000} \\ &= 2/9 = .22 \end{aligned}$$

$$\text{Total Incidence (including fatalities)} = \frac{(8 \times 200,000)}{900 \times 2000} = 8/9 = .89$$

(b) Comparing National Safety Council Statistics for 2000 (see Figure 2.2 of the text):

Total incidence (including fatalities)
 .89 << 6.8 therefore, much safer than the all industry average

2.30. Note to instructor, as is sometimes the case, despite the authors' best efforts there was a change to the OSHA form 300 in the first printing of the Seventh Edition which has been subsequently changed in subsequent printings. The column K and column L were reversed. Please share the updated Figure 2.9 below with your students when assigning this problem.

OSHA's Form 300 (Rev. 01/2004)
Log of Work-Related Injuries and Illnesses

Attention: This form contains information relating to employee health and must be used in a manner that protects the confidentiality of employees to the extent possible while the information is being used for occupational safety and health purposes.

Year 20 2014

U.S. Department of Labor
 Occupational Safety and Health Administration

You must record information about every work-related death and about every work-related injury or illness that involves loss of consciousness, restricted work activity or job transfer, days away from work, or medical treatment beyond first aid. You must also record significant work-related injuries and illnesses that are diagnosed by a physician or licensed health care professional. You must also record work-related injuries and illnesses that meet any of the specific recording criteria listed in 29 CFR Part 1904.6 through 1904.12. Feel free to use two lines for a single case if you need to. You must complete an Injury and Illness Incident Report (OSHA Form 301) or equivalent form for each injury or illness recorded on this form. If you're not sure whether a case is recordable, call your local OSHA office for help.

Public reporting burden for this collection of information is estimated to average 14 minutes per response, including time to review the instructions, search existing data sources, gather the data needed, and complete and review the collection of information. Persons are not required to respond to the collection of information unless it displays a currently valid OMB control number. If you have any comments about these estimates or any other aspect of this data collection, send them to: U.S. Department of Labor, OSHA Office of Statistical Analysis, Room N-3663, 220 Constitution Avenue, NW, Washington, DC 20219. Do not send the completed forms to this office.

Be sure to transfer these totals to the Summary page (Form 3004) before you post it.

Page ____ of ____

(1) (2) (3) (4) (5) (6)

To complete the table, add up the columns to get the following totals:

File	G	H	I	J	K	L	M1	M2	M3	M4	M5
Column totals:	1	2	3	3	16	67	4	2	2	0	1

The following calculations are compared to National Safety Council (NSC) estimates reported in Injury Facts, 2016 edition (numbers reported are 2014):

Cases Involving Days

$$\text{Away From Work \& Deaths (cols G + H)} = \frac{(1+2) \times 200,000}{165 \times 2000} = 1.82 \text{ versus } 1.8 \text{ (NSC)}$$

$$\text{Total recordable cases (cols G + H + I + J)} = \frac{(1+2+3+3) \times 200,000}{165 \times 2000} = 5.45 \text{ vs } 6.1 \text{ (NSC)}$$

$$\text{Days Away From Work (cols L)} = \frac{16 \times 200,000}{165 \times 2000} = 9.70$$

(Injury Facts, 2016 edition, reports 85,000,000 days away from work for injuries incurred in the previous year (2001). The total worker force was estimated at approximately 136,500,000. Applying the formula to the national data:

$$\text{Days Away From Work} = \frac{65,000,000 \times 200,000}{146,307,000 \times 2000} = 44.43$$

This figure is considerably higher than the 9.70 figure calculated for the data in this problem.

- 2.34. Social Media has brought about increased scrutiny on companies with poor safety records and is one of the hidden costs from the tip of the iceberg.
- 2.35. Each year the NSC publishes updates for these estimates in Injury Facts. Students might want to check the library for the latest update. The 2016 edition shows the following estimates:
fatality: \$1,000,000
worker injury: \$29,000
- 2.36. A shooting in a nightclub killing 49 people.
- 2.37. Action on Smoking and Health lobbies for OSHA to promulgate a standard on Indoor Air Quality. OSHA has proposed a standard, but as of early 2018 it had not been promulgated as a Final Standard.
- 2.38. Workplace violence
- 2.39. The company did preemployment drug screening tests for all applicants in a three month hiring period (750 applicants). Surprisingly, half of the 750 applicants failed the test. The test was a urinalysis designed to indicate whether drugs had been used in the preceding two or three days and was conducted by a hospital laboratory service. The test results indicated that the use of marijuana was the most prevalent. ALCOA hired 130 applicants who passed the test and reported that as a group those hired were better workers than those hired prior to the drug screening program.
- 2.40. The firm may face discrimination charges unless it is fair and even-handed in its policies for hiring and employee termination in cases of alcohol or drug abuse. The same rules that are applied to new employees should be applied to existing employees.
- 2.41. No; workplace homicide is often associated with despair over downsizing or a termination notice for some other reason. There is evidence that homicide in the workplace is committed in a methodical and selective way.
- 2.42. Although pre-employment testing has been shown to be effective in recruiting dependable and safer employees, the program can run afoul of Title VII of the Civil Rights Act of 1964 if the testing program is discriminatory against females or racial minorities. The EEOC has published guidelines for such programs. Of particular interest is the comparative failure rates of the tests when the scores of white males is compared to those of females or racial minorities. Another consideration

is the Americans with Disabilities Act that protects disabled workers in much the same way as the Civil Rights Act protects females and racial minorities.

- 2.43.
 - a. control of sharps
 - b. effective system of housekeeping
 - c. effective laundry
 - d. effective disposal of waste
 - e. washing, cleaning, and disinfecting exposed surfaces
 - f. provision for storage and consumption of food in areas protected from exposure
 - g. prohibition of application of cosmetics, lip balm, or contact lenses in exposed areas of the plant
 - h. provision of personal protective equipment.
- 2.44. the eyes
- 2.45 The table is considered independent of inflation, as the unit of measure is "weeks" of compensation, not dollars.
- 2.46 To show an interest in the well-being of the employee and uncover fraudulent claims.
- 2.47 The number-of-lost-workdays rate counts all lost workdays (by definition one or more days for each case, whereas the LWDI is a count of incidents with one or more lost workdays. Since each lost-workday incident must have one or more days, it will always be as high or higher than the LWDI
- 2.48 The intent was to create a higher level of public visibility of employers with high injury rates to "nudge" them to action. This data also helped OSHA to use this "big data" to target compliance assistance and enforcement efforts.
- 2.49 There is a trend in states allowing employers to opt out of worker's compensation programs. This provides savings but opens employers up to costly litigation in the event of an injury.
- 2.50 Most "gig" workers are not classified as employees but rather as contractors. As such, most are not covered under worker's compensation. Uber is a leading company with a high number of gig employees.
- 2.51 While worker's compensation covers 100% of the medical costs associated with a permanent injury, the payments for permanent disability do not last forever. Therefore many employers subsidize short-term and long-term disability insurance.
- 2.52 Many workers who re-enter the workforce do so with permanent injuries that can on average result in a 15% decrease in earning potential going forward.
- 2.53 The legalization of marijuana in some states while still illegal at a federal level has caused instances where legal recreational use of marijuana has resulted in failure of random drug tests and employee dismissal in some cases.
- 2.54 No. Any employer who can reasonably expect exposure to bloodborne pathogens for their employees is required to have a written exposure plan.
- 2.55 In 2008, there was a change in reporting to use hours worked instead of employment-based rates. When comparing fatality data for the last eighty years these changes in reporting method stand out from the gradual year-over-year reduction in fatalities.
- 2.56 Days of restricted work activity.
