$$(2+3) \cdot 4 = 5 \cdot 4 = 20$$

since operations inside parentheses come before multiplication in the order of operations for real numbers.

$$107. \text{ Subtraction is not commutative; for example: } 2-3 = -1 \neq 1 = 3-2.$$

108. Subtraction is not associative; for example: $(5 - 2) - 1 = 2 \neq 4 = 5 - (2 - 1)$.
109. Division is not commutative; for example:
 $\frac{2}{3} \neq \frac{3}{2}$.
110. Division is not associative; for example: $(12 \div 2) \div 2 = 6 \div 2 = 3$, but
 $12 \div (2 \div 2) = 12 \div 1 = 12$.
111. The Symmetric Property implies that if $2 = x$, then $x = 2$.
112. From the *principle of substitution*, if $x = 5$, then
 $(x)(x) = (5)(5)$
 $\Rightarrow x^2 = 25$
 $\Rightarrow x^2 + x = 25 + 5$
 $\Rightarrow x^2 + x = 30$
113. There are no real numbers that are both rational and irrational, since an irrational number, by definition, is a number that cannot be expressed as the ratio of two integers; that is, not a rational number.
 Every real number is either a rational number or an irrational number, since the decimal form of a real number either involves an infinitely repeating pattern of digits or an infinite, non-repeating string of digits.
114. The sum of an irrational number and a rational number must be irrational. Otherwise, the irrational number would then be the difference of two rational numbers, and therefore would have to be rational.
115. Answers will vary.
116. Since 1 day = 24 hours, we compute
 $\frac{12997}{24} = 541.541\bar{6}$.
 Now we only need to consider the decimal part of the answer in terms of a 24 hour day. That is,
 $(0.541\bar{6})(24) \approx 13$ hours. So it must be 13 hours later than 12 noon, which makes the time 1 AM CST.

$$\frac{135}{2} = x \text{ or } x = 67.5$$

In addition, corresponding angles must have the same angle measure. Therefore, we have

$$A = 60^\circ, B = 95^\circ, \text{ and } C = 25^\circ.$$

46. Since the triangles are similar, the lengths of corresponding sides are proportional. Therefore, we get

$$\frac{8}{10} = \frac{x}{50}$$

$$\frac{8 \cdot 50}{10} = x$$

$$40 = x$$

In addition, corresponding angles must have the same angle measure. Therefore, we have

$$A = 50^\circ, B = 125^\circ, \text{ and } C = 5^\circ.$$

47. The total distance traveled is 4 times the circumference of the wheel.
 Total Distance = $4C = 4(\pi d) = 4\pi \cdot 16$
 $= 64\pi \approx 201.1$ inches ≈ 16.8 feet

48. The distance traveled in one revolution is the circumference of the disk 4π .
 The number of revolutions =
 $\frac{\text{dist. traveled}}{\text{circumference}} = \frac{20}{4\pi} = \frac{5}{\pi} \approx 1.6$ revolutions

49. Area of the border = area of EFGH – area of ABCD
 $= 10^2 - 6^2 = 100 - 36 = 64$ ft²

50. FG = 4 feet; BG = 4 feet and BC = 10 feet, so CG = 6 feet. The area of the triangle CGF is:
 $A = \frac{1}{2} \cdot (4)(6) = 12$ ft²

51. Area of the window = area of the rectangle + area of the semicircle.

$$A = (6)(4) + \frac{1}{2} \cdot \pi \cdot 2^2 = 24 + 2\pi \approx 30.28$$
 ft²

Perimeter of the window = 2 heights + width + one-half the circumference.

$$P = 2(6) + 4 + \frac{1}{2} \cdot \pi(4) = 12 + 4 + 2\pi$$

 $= 16 + 2\pi \approx 22.28$ feet

52. Area of the deck = area of the pool and deck – area of the pool.

$$A = \pi(13)^2 - \pi(10)^2 = 169\pi - 100\pi$$

 $= 69\pi$ ft² ≈ 216.77 ft²

The amount of fence is the circumference of the circle with radius 13 feet.

$$C = 2\pi(13) = 26\pi$$
 ft ≈ 81.68 ft

53. We can form similar triangles using the Great Pyramid's height/shadow and Thales' height/shadow:

This allows us to write

$$\frac{h}{240} = \frac{2}{3}$$

$$h = \frac{2 \cdot 240}{3} = 160$$

The height of the Great Pyramid is 160 paces.

54. Let x = the approximate distance from San Juan to Hamilton and y = the approximate distance from Hamilton to Fort Lauderdale. Using similar triangles, we get

$$\frac{1046}{58} = \frac{x}{53.5} \qquad \frac{1046}{58} = \frac{y}{57}$$

$$\frac{1046 \cdot 53.5}{58} = x \qquad \frac{1046 \cdot 57}{58} = y$$

$$964.8 \approx x \qquad 1028.0 \approx y$$

The approximate distance between San Juan and Hamilton is 965 miles and the approximate distance between Hamilton and Fort Lauderdale is 1028 miles.

55. Convert 20 feet to miles, and solve the Pythagorean Theorem to find the distance:

$$20 \text{ feet} = 20 \text{ feet} \cdot \frac{1 \text{ mile}}{5280 \text{ feet}} = 0.003788 \text{ miles}$$

$$d^2 = (3960 + 0.003788)^2 - 3960^2 = 30 \text{ sq. miles}$$

$$d \approx 5.477 \text{ miles}$$

56. Convert 6 feet to miles, and solve the Pythagorean Theorem to find the distance:

$$6 \text{ feet} = 6 \text{ feet} \cdot \frac{1 \text{ mile}}{5280 \text{ feet}} = 0.001136 \text{ miles}$$

$$d^2 = (3960 + 0.001136)^2 - 3960^2 = 9 \text{ sq. miles}$$

$$d \approx 3 \text{ miles}$$

57. Convert 100 feet to miles, and solve the Pythagorean Theorem to find the distance:

$$100 \text{ feet} = 100 \text{ feet} \cdot \frac{1 \text{ mile}}{5280 \text{ feet}} = 0.018939 \text{ miles}$$

$$d^2 = (3960 + 0.018939)^2 - 3960^2 \approx 150 \text{ sq. miles}$$

$$d \approx 12.2 \text{ miles}$$

Convert 150 feet to miles, and solve the Pythagorean Theorem to find the distance:

$$150 \text{ feet} = 150 \text{ feet} \cdot \frac{1 \text{ mile}}{5280 \text{ feet}} = 0.028409 \text{ miles}$$

$$d^2 = (3960 + 0.028409)^2 - 3960^2 \approx 225 \text{ sq. miles}$$

$$d \approx 15.0 \text{ miles}$$

58. Given $m > 0$, $n > 0$ and $m > n$,

if $a = m^2 - n^2$, $b = 2mn$ and $c = m^2 + n^2$, then

$$\begin{aligned} a^2 + b^2 &= (m^2 - n^2)^2 + (2mn)^2 \\ &= m^4 - 2m^2n^2 + n^4 + 4m^2n^2 \\ &= m^4 + 2m^2n^2 + n^4 \end{aligned}$$

$$\text{and } c^2 = (m^2 + n^2)^2 = m^4 + 2m^2n^2 + n^4$$

$\therefore a^2 + b^2 = c^2 \rightarrow a, b$ and c represent the sides of a right triangle.

59. $V = \pi r^2 h$

$$= \pi(10)^2(4.5)$$

$$= 450\pi \text{ ft}^3$$

So, $1 \text{ ft}^3 \approx 7.48052 \text{ gal}$ so

$$(450\pi \text{ ft}^3)(7.48052 \text{ gal/ft}^3) \approx 10,575 \text{ gal}$$

60. $10000(5.61458) = 56145.8 \text{ ft}^3$

$$V = \pi r^2 h$$

$$56145.8 = \pi(25)^2 h$$

$$h = \frac{56145.8}{625\pi} = 28.6 \text{ ft}$$

61. $A = \pi r^2$

$$A_2 = \pi(2r)^2$$

$$= \pi 4r^2$$

$$= 4\pi r^2 = 4A$$

If you double the radius, the area is four times the original area.

62. $V = \frac{4}{3}\pi r^3$

$$V_2 = \frac{4}{3}\pi(2r)^3$$

$$= \frac{4}{3}\pi \cdot 8r^3$$

$$= 8 \cdot \frac{4}{3}\pi r^3 = 8V$$

If you double the radius the volume is 8 times the original volume.

63. Let l = length of the rectangle and w = width of the rectangle.

Notice that

$$\begin{aligned} (l+w)^2 - (l-w)^2 &= [(l+w) + (l-w)][(l+w) - (l-w)] \\ &= (2l)(2w) = 4lw = 4A \end{aligned}$$

$$\text{So } A = \frac{1}{4}[(l+w)^2 - (l-w)^2]$$

Since $(l-w)^2 \geq 0$, the largest area will occur when $l-w=0$ or $l=w$; that is, when the rectangle is a square. But

$$1000 = 2l + 2w = 2(l+w)$$

$$500 = l + w = 2l$$

$$250 = l = w$$

The largest possible area is $250^2 = 62500 \text{ sq ft}$.

A circular pool with circumference = 1000 feet

yields the equation: $2\pi r = 1000 \Rightarrow r = \frac{500}{\pi}$

The area enclosed by the circular pool is:

$$A = \pi r^2 = \pi \left(\frac{500}{\pi} \right)^2 = \frac{500^2}{\pi} \approx 79577.47 \text{ ft}^2$$

Thus, a circular pool will enclose the most area.

64. Consider the diagram showing the lighthouse at point L, relative to the center of Earth, using the radius of Earth as 3960 miles. Let P refer to the furthest point on the horizon from which the light is visible. Note also that

$$362 \text{ feet} = \frac{362}{5280} \text{ miles.}$$

Chapter R: Review

Apply the Pythagorean Theorem to $\triangle CPL$:

$$(3960)^2 + (d_1)^2 = \left(3960 + \frac{362}{5280}\right)^2$$

$$(d_1)^2 = \left(3960 + \frac{362}{5280}\right)^2 - (3960)^2$$

$$d_1 = \sqrt{\left(3960 + \frac{362}{5280}\right)^2 - (3960)^2} \approx 23.30 \text{ mi.}$$

Therefore, the light from the lighthouse can be seen at point P on the horizon, where point P is approximately 23.30 miles away from the lighthouse. Brochure information is slightly overstated.

Verify the ship information:

Let S refer to the ship's location, and let x equal the height, in feet, of the ship.

We need $d_1 + d_2 \geq 40$.

Since $d_1 \approx 23.30$ miles we need

$$d_2 \geq 40 - 23.30 = 16.70 \text{ miles.}$$

Apply the Pythagorean Theorem to $\triangle CPS$:

$$(3960)^2 + (16.7)^2 = (3960 + x)^2$$

$$\sqrt{(3960)^2 + (16.7)^2} = 3960 + x$$

$$\sqrt{(3960)^2 + (16.7)^2} - 3960 = x$$

$$x \approx 0.035 \text{ miles}$$

$$x \approx 185.93 \text{ feet.}$$

The ship would have to be at least 186 feet tall to see the lighthouse from 40 miles away.

Verify the airplane information:

Let A refer to the airplane's location. The distance from the plane to point P is d_2 .

We want to show that $d_1 + d_2 \geq 120$.

Assume the altitude of the airplane is

$$10,000 \text{ feet} = \frac{10000}{5280} \text{ miles.}$$

Apply the Pythagorean Theorem to $\triangle CPA$:

$$(3960)^2 + (d_2)^2 = \left(3960 + \frac{10000}{5280}\right)^2$$

$$(d_2)^2 = \left(3960 + \frac{10000}{5280}\right)^2 - (3960)^2$$

$$d_2 = \sqrt{\left(3960 + \frac{10000}{5280}\right)^2 - (3960)^2} \approx 122.49 \text{ miles.}$$

$$\text{re, } d_1 + d_2 \approx 23.30 + 122.49 = 145.79 \geq 120.$$

The brochure information is slightly understated.

Note that a plane at an altitude of 6233 feet could see the lighthouse from 120 miles away.

108. The products $(x+y)(x-y)$ and $(z+w)(z-w)$ will each result in a binomial that is the difference of squares. The product of those resulting binomials will have 4 terms.
109. When we multiply polynomials $p_1(x)$ and $p_2(x)$, each term of $p_1(x)$ will be multiplied by each term of $p_2(x)$. So when the highest-powered term of $p_1(x)$ multiplies by the highest powered term of $p_2(x)$, the exponents on the variables in those terms will add according to the basic rules of exponents. Therefore, the highest powered term of the product polynomial will have degree equal to the sum of the degrees of $p_1(x)$ and $p_2(x)$.
110. When we add two polynomials $p_1(x)$ and $p_2(x)$, where the degree of $p_1(x) \neq$ the degree of $p_2(x)$, each term of $p_1(x)$ will be added to each term of $p_2(x)$. Since only the terms with equal degrees will combine via addition, the degree of the sum polynomial will be the degree of the highest powered term overall, that is, the degree of the polynomial that had the higher degree.
111. When we add two polynomials $p_1(x)$ and $p_2(x)$, where the degree of $p_1(x)=$ the degree

of $p_2(x)$, the new polynomial will have degree $\leq$ the degree of $p_1(x)$ and $p_2(x)$.

$c: 0, 1, 1, 2, 3, 5, 8, 13, 21, \dots$

In each case we have a *Fibonacci sequence*, where the next value in the list is obtained from the sum of the previous 2 values in the list.

 \underline{ \sqrt{3} \quad 3-4\sqrt{3} \quad -12} \\
 1 \quad \sqrt{3}-4 \quad -4\sqrt{3} \quad 1

The quotient is $x^2 + (\sqrt{3} - 4)x - 4\sqrt{3}$

The remainder is 1

Yes, $1+\sqrt{2}$ is a factor of $x^3 - 9x^2 + 13x + 7$.

139. Answers may vary. One possibility follows: If

$$a = -5, \text{ then } \sqrt{a^2} = \sqrt{(-5)^2} = \sqrt{25} = 5 \neq a.$$

Since we use the principal square root, which is always non-negative,

$$\sqrt{a^2} = \begin{cases} a & \text{if } a \geq 0 \\ -a & \text{if } a < 0 \end{cases}$$

which is the definition of $|a|$, so $\sqrt{a^2} = |a|$.
