Chapter 2 Atoms and Elements

1) Which of the following is an example of the law of multiple proportions?

- A) A sample of chlorine is found to contain three times as much Cl-35 as Cl-37.
- B) Two different compounds formed from carbon and oxygen have the following mass ratios: 1.33 g O: 1 g C and 2.66 g O: 1 g C.
- C) Two different samples of table salt are found to have the same ratio of sodium to chlorine.
- D) The atomic mass of bromine is found to be 79.90 amu.
- E) Nitrogen dioxide always has a mass ratio of 2.28 g O: 1 g N.

2) Which of the following statements is **false** according to Dalton's Atomic Theory?

- A) Atoms combine in simple whole number ratios to form compounds.
- B) All atoms of chlorine have identical properties that distinguish them from other elements.
- C) One carbon atom will combine with one oxygen atom to form a molecule of carbon monoxide.
- D) Atoms of sodium do not change into another element during chemical reaction with chlorine.
- E) An atom of nitrogen can be broken down into smaller particles that will still have the unique properties of nitrogen.

62) Describe an atom and what it is made up of according to modern atomic theory.

Answer: An atom is made up of a nucleus surrounded by electrons. The nucleus contains protons (positively charged particles) and neutrons (neutral particles) and is where most of the mass of an atom comes from, but is a tiny fraction of an atom's volume. The nucleus is surrounded by negatively charged electrons, the same number as there are protons in the nucleus. An atom is therefore neutral overall.

Diff: 2 Var: 1 Page Ref: 2.4

Global: G1, G8

63) Why do the isotopes of the same element have the same atomic size?

Answer: Isotopes only differ in the number of neutrons contained within the nucleus. Since the size of an atom is determined by the electrons, isotopes of the same element should be the same size.

64) Why doesn't a mass spectrum of silver have a peak at 107.9 amu?

Answer: The average atomic mass of silver is 107.9 amu, but there are no atoms of silver that weigh 107.9 amu. One isotope weighs more and another weighs less.

Diff: 1 Var: 1 Page Ref: 2.5

Global: G1, G8

LO: 2.5

65) Are anions typically larger or smaller than their corresponding atom? Why?

Answer: Anions are larger than their corresponding atom because the anion contains more electrons than the atom. Since electrons repel one another **and** determine the size of the atom or ion, adding electrons to the atom to form an anion makes it larger.

68) Why do elements in the same group tend to have similar chemical properties?

Answer: Since elements in the same group have the same number of valence electrons (similar electron configurations) they tend to have similar chemical reactivity, since chemical reactions typically involve valence electrons.

Diff: 1 Var: 1 Page Ref: 2.6

69) What group of elements in the periodic table are the most unreactive and why?

Answer: The noble gases are the most unreactive since they do not combine with other elements to form compounds.
