## **Chapter 02 - Cells and Cell Division**

### **True / False**

1. Mitotic divisions reduce the number of chromosomes found in daughter cells.

- a. True
- b. False

**ANSWER:** False

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-1 - Summarize the three phases of the cell cycle: interphase, mitosis, and cytokinesis.

2. Cytokinesis usually occurs just prior to mitosis.

- a. True
- b. False

**ANSWER:** False

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-1 - Summarize the three phases of the cell cycle: interphase, mitosis, and cytokinesis.

3. Autosomal chromosome pairs are identical, whereas the sex chromosome pair in males is not.

- a. True
- b. False

**ANSWER:** True

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-3 Cell Structure Reflects Function

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-3-3 - Differentiate between the major cellular organelles and state their functions.

4. Crossing over is partially responsible for our genetic diversity.

- a. True
- b. False

**ANSWER:** True

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-6 Cell Division by Meiosis: The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-6-3 - Explain the two processes of meiosis that create new combinations of genes.

5. Random assortment occurs between chromatids of homologous chromosome pairs.

- a. True
- b. False

**ANSWER:** False

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-6 Cell Division by Meiosis: The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-6-3 - Explain the two processes of meiosis that create new combinations of genes.

## **Chapter 02 - Cells and Cell Division**

6. A polar body, once formed, has no further function and dies.

- a. True
- b. False

**ANSWER:** True

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-7 Formation of Gametes

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-7-1 - Define the term gamete and outline the sequence of events leading to the formation of both male and female gametes.

7. One treatment for Gaucher disease is enzyme replacement therapy.

- a. True
- b. False

**ANSWER:** True

**DIFFICULTY:** Bloom's: Remember

**REFERENCES:** 2-1 Cellular Links to Genetic Disease

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-1-1 - Describe an example of how cell structure and function are influenced by genetic information.

8. Primary oocytes and spermatogonia are both haploid cells.

- a. True
- b. False

**ANSWER:** False

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-7 Formation of Gametes

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-7-1 - Define the term gamete and outline the sequence of events leading to the formation of both male and female gametes.

9. The four macromolecules making up our cells allow for the same structure and function across all cells in the body.

- a. True
- b. False

**ANSWER:** False

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-2 The Chemistry of Cells

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.

10. Mitosis is a process that is unique to humans.

- a. True
- b. False

**ANSWER:** False

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-5 Mitosis Is Essential for Growth and Cell Replacement

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-5-1 - Discuss the importance of mitosis for growth and cell replacement and identify possible consequences when cell cycle regulation is interrupted.

## **Chapter 02 - Cells and Cell Division**

### **Multiple Choice**

11. The process of meiosis results in \_\_\_\_.
- a. the production of four identical cells
  - b. no change in the chromosome number from parental cells
  - c. a doubling of the chromosome number
  - d. a reduction in the chromosome number
  - e. two diploid cells

*ANSWER:* d

*DIFFICULTY:* Bloom's: Understand

*REFERENCES:* 2-6 Cell Division by Meiosis: The Basis of Sex

*LEARNING OBJECTIVES:* HUHE.CUMM.16.2-6-2 - Illustrate the stages of meiosis I and meiosis II and describe what occurs at each stage.

12. In the cell cycle, the G1 phase represents \_\_\_\_.
- a. the stage of DNA synthesis
  - b. splitting of the chromosomes into chromatids
  - c. a period of growth
  - d. the stage of actual cell division
  - e. the stage just prior to meiosis

*ANSWER:* c

*DIFFICULTY:* Bloom's: Understand

*REFERENCES:* 2-4 The Cell Cycle Describes the Life History of a Cell

*LEARNING OBJECTIVES:* HUHE.CUMM.16.2-4-2 - List the three stages of interphase and explain what occurs at each stage.

13. Ribosomes are organelles that are involved in \_\_\_\_.
- a. plasma membrane selectivity
  - b. cellular energy production
  - c. protein synthesis
  - d. transport of materials
  - e. DNA replication

*ANSWER:* c

*DIFFICULTY:* Bloom's: Understand

*REFERENCES:* 2-3 Cell Structure Reflects Function

*LEARNING OBJECTIVES:* HUHE.CUMM.16.2-3-3 - Differentiate between the major cellular organelles and state their functions.

14. Which genetic diseases involve defects in DNA repair that affect cell division?
- a. Gaucher disease and Werner syndrome
  - b. Kearns-Sayre syndrome and progeria
  - c. progeria and Gaucher disease
  - d. Gaucher disease and cystic fibrosis
  - e. progeria and Werner syndrome

*ANSWER:* e

## **Chapter 02 - Cells and Cell Division**

**DIFFICULTY:** Bloom's: Remember

**REFERENCES:** 2-5 Mitosis Is Essential for Growth and Cell Replacement

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-5-1 - Discuss the importance of mitosis for growth and cell replacement and identify possible consequences when cell cycle regulation is interrupted.

15. Autosomes represent \_\_\_\_.
- a. all chromosomes including the sex chromosomes
  - b. the half of the chromosomes inherited from one parent
  - c. all chromosomes other than the sex chromosomes
  - d. chromosome pairs with unlike members
  - e. those chromosomes found only in gametes

**ANSWER:** c

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-3 Cell Structure Reflects Function

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-3-3 - Differentiate between the major cellular organelles and state their functions.

16. During meiosis in an organism where  $2n = 8$ , how many chromatids will be present in a cell at the beginning of meiosis II?
- a. 2
  - b. 4
  - c. 6
  - d. 8
  - e. 12

**ANSWER:** d

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-6 Cell Division by Meiosis: The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-6-2 - Illustrate the stages of meiosis I and meiosis II and describe what occurs at each stage.

17. The Hayflick limit describes \_\_\_\_.
- a. the size limit to which a cell can grow
  - b. the number of divisions a cultured cell can undergo
  - c. the largest number of chromosomes an organism can possess
  - d. the most cells an organism can have
  - e. how rapidly DNA replication can occur

**ANSWER:** b

**DIFFICULTY:** Bloom's: Remember

**REFERENCES:** 2-5 Mitosis Is Essential for Growth and Cell Replacement

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-5-1 - Discuss the importance of mitosis for growth and cell replacement and identify possible consequences when cell cycle regulation is interrupted.

18. In meiosis, homologous chromosomes separate in \_\_\_\_.
- a. metaphase I
  - b. anaphase I

## **Chapter 02 - Cells and Cell Division**

- c. metaphase II
- d. anaphase II
- e. telophase

**ANSWER:** b

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-3 - Outline the four stages of mitosis and describe the characteristics of each stage.

19. A cell that cannot form spindle fibers cannot \_\_\_\_.

- a. engage in energy production
- b. exchange gases across the plasma membrane
- c. perform mitosis nor meiosis
- d. perform DNA replication
- e. engage in protein synthesis

**ANSWER:** c

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell | 2-6 Cell Division by Meiosis: The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-3 - Outline the four stages of mitosis and describe the characteristics of each stage.

20. A cell in G<sub>0</sub> state \_\_\_\_.

- a. is actively growing before cell division begins
- b. has a cleavage furrow and the cytoplasm is beginning to divide
- c. is actively replicating chromosomes
- d. is in cytokinesis
- e. has entered a resting stage and is not actively dividing

**ANSWER:** e

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-1 - Summarize the three phases of the cell cycle: interphase, mitosis, and cytokinesis.

21. A centromere is least likely to \_\_\_\_.

- a. divide in anaphase of mitosis
- b. connect sister chromatids
- c. attach chromosomes to spindle fibers
- d. cross over during prophase I of meiosis
- e. be a component of DNA

**ANSWER:** d

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell | 2-6 Cell Division by Meiosis; The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-3 - Outline the four stages of mitosis and describe the characteristics

## **Chapter 02 - Cells and Cell Division**

of each stage.

22. The underlying problem in Gaucher disease is \_\_\_\_.
- a. the spontaneous breakdown of red blood cells
  - b. the accumulation of fat in white blood cells
  - c. the breakdown of the myelin sheath around nerves
  - d. a hypertrophied spleen
  - e. the lack of critical liver enzymes

ANSWER: b

DIFFICULTY: Bloom's: Remember

REFERENCES: 2-1 Cellular Links to Genetic Disease

LEARNING OBJECTIVES: HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.

23. Which biomolecule is most associated with the structure and function of cell membranes?
- a. Polysaccharides
  - b. steroids
  - c. DNA
  - d. phospholipids
  - e. ATP

ANSWER: d

DIFFICULTY: Bloom's: Understand

REFERENCES: 2-2 The Chemistry of Cells

LEARNING OBJECTIVES: HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.

24. Proteins function \_\_\_\_.
- a. as energy carriers
  - b. as the 'backbone' of the DNA molecule
  - c. as component parts of enzymes
  - d. in energy storage within the cell nucleus
  - e. in transmission of genetic information

ANSWER: c

DIFFICULTY: Bloom's: Understand

REFERENCES: 2-2 The Chemistry of Cells  
2-3 Cell Structure Reflects Function

LEARNING OBJECTIVES: HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.  
HUHE.CUMM.16.2-3-3 - Differentiate between the major cellular organelles and state their functions.

25. Ribosomes are most closely associated with \_\_\_\_.
- a. the Golgi complex
  - b. lysosomes
  - c. mitochondria
  - d. smooth endoplasmic reticulum

## **Chapter 02 - Cells and Cell Division**

- e. the cytoplasm and rough endoplasmic reticulum

**ANSWER:**

e

**DIFFICULTY:**

Bloom's: Understand

**REFERENCES:**

2-3 Cell Structure Reflects Function

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-3-3 - Differentiate between the major cellular organelles and state their functions.

26. In meiosis, cells become haploid \_\_\_\_.

- a. at the end of telophase I
- b. during metaphase I
- c. during anaphase I
- d. at the beginning of metaphase II
- e. at the end of prophase II

**ANSWER:**

a

**DIFFICULTY:**

Bloom's: Understand

**REFERENCES:**

2-6 Cell Division by Meiosis: The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-6-2 - Illustrate the stages of meiosis I and meiosis II and describe what occurs at each stage.

27. In meiosis of oogenesis, how many mature eggs result?

- a. one
- b. two
- c. three
- d. four
- e. five

**ANSWER:**

a

**DIFFICULTY:**

Bloom's: Understand

**REFERENCES:**

2-7 Formation of Gametes

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-7-1 - Define the term gamete and outline the sequence of events leading to the formation of both male and female gametes.

28. During spermatogenesis in meiosis II, \_\_\_\_ form(s).

- a. primary spermatocytes
- b. secondary spermatocytes
- c. spermatids
- d. mature sperm
- e. a zygote

**ANSWER:**

c

**DIFFICULTY:**

Bloom's: Understand

**REFERENCES:**

2-7 Formation of Gametes

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-7-1 - Define the term gamete and outline the sequence of events leading to the formation of both male and female gametes.

29. A rare genetic disorder called Gaucher disease may strike as many as one in 450 people of \_\_\_\_ descent.

- a. Middle Eastern

## **Chapter 02 - Cells and Cell Division**

- b. Western European
- c. African American
- d. British
- e. Eastern European

**ANSWER:** e

**DIFFICULTY:** Bloom's: Remember

**REFERENCES:** 2-1 Cellular Links to Genetic Disease

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-1-1 - Describe an example of how cell structure and function are influenced by genetic information.

30. Macromolecules including sugars, glycogen, and starches composed of sugar monomers linked and cross-linked together are known as \_\_\_\_.

- a. carbohydrates
- b. lipids
- c. proteins
- d. fatty acids
- e. nucleic acids

**ANSWER:** a

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-2 The Chemistry of Cells

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.

31. Carbohydrates \_\_\_\_.

- a. act as energy sources for cells
- b. include fats and oils
- c. are made of nucleic acids
- d. act as protein builders
- e. are also called steroids

**ANSWER:** a

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-2 The Chemistry of Cells

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.

32. Large cellular polymers assembled by chemically linking monomers together are called \_\_\_\_.

- a. carbohydrates
- b. lipids
- c. proteins
- d. nucleic acids
- e. macromolecules

**ANSWER:** e

**DIFFICULTY:** Bloom's: Remember

**REFERENCES:** 2-2 The Chemistry of Cells

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and

## **Chapter 02 - Cells and Cell Division**

explain how structure and function are interrelated in each.

### **Completion**

33. There are \_\_\_\_\_ autosomes present in a human sperm cell.

**ANSWER:** 22  
twenty-two  
twenty two

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-7 Formation of Gametes

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-7-1 - Define the term gamete and outline the sequence of events leading to the formation of both male and female gametes.

HUHE.CUMM.16.2-7-2 - Establish the significance of meiosis in the formation of gametes.

34. The chromosomal structure that anchors the spindle fiber to the chromosome is known as the \_\_\_\_\_.

**ANSWER:** centromere

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-3 - Outline the four stages of mitosis and describe the characteristics of each stage.

35. In mitosis, chromatids separate and move to the center of the cell during \_\_\_\_\_.

**ANSWER:** metaphase

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-3 - Outline the four stages of mitosis and describe the characteristics of each stage.

36. In meiosis, sister chromatids separate and move to opposite poles of the spindle during \_\_\_\_\_.

**ANSWER:** anaphase II

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-6 Cell Division by Meiosis: The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-6-2 - Illustrate the stages of meiosis I and meiosis II and describe what occurs at each stage.

37. In cell division, toward the end of nuclear division, the cytoplasm divides by a process called \_\_\_\_\_ to produce two identical cells.

**ANSWER:** cytokinesis

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-1 - Summarize the three phases of the cell cycle: interphase, mitosis, and cytokinesis.

38. The only cytoplasmic organelles in animal cells aside from nuclei that contain DNA are \_\_\_\_\_.

**ANSWER:** mitochondria

**DIFFICULTY:** Bloom's: Remember

## **Chapter 02 - Cells and Cell Division**

**REFERENCES:** 2-3 Cell Structure Reflects Function

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-3-3 - Differentiate between the major cellular organelles and state their functions.

39. The series of flattened sacs and associated vesicles in the cytoplasm of a cell is the \_\_\_\_\_.

**ANSWER:** Golgi complex

**DIFFICULTY:** Bloom's: Remember

**REFERENCES:** 2-3 Cell Structure Reflects Function

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-3-3 - Differentiate between the major cellular organelles and state their functions.

40. Cells are largely constructed from four classes of large molecules called \_\_\_\_\_.

**ANSWER:** macromolecules

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-2 The Chemistry of Cells

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.

41. The condition in which each chromosome is represented twice as a member of a homologous pair is called \_\_\_\_\_.

**ANSWER:** diploid  
 $2n$

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-6 Cell Division by Meiosis: The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-6-2 - Illustrate the stages of meiosis I and meiosis II and describe what occurs at each stage.

42. \_\_\_\_\_ is a symptom of Gaucher disease (indicate any one).

**ANSWER:** Brittle bones  
Fatigue  
Painful abdomen  
Tender abdomen  
Enlarged spleen  
Enlarged liver

**DIFFICULTY:** Bloom's: Remember

**REFERENCES:** 2-1 Cellular Links to Genetic Disease

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-1-1 - Describe an example of how cell structure and function are influenced by genetic information.

43. \_\_\_\_\_ is used to diagnose and treat genetic disorders.

**ANSWER:** Genetic testing  
Genetic counseling

**DIFFICULTY:** Bloom's: Remember

**REFERENCES:** 2-1 Cellular Links to Genetic Disease

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-1-1 - Describe an example of how cell structure and function are influenced by genetic information.

44. Lipids are a class of cellular macromolecules that are \_\_\_\_\_ in water.

## **Chapter 02 - Cells and Cell Division**

*ANSWER:* insoluble

*DIFFICULTY:* Bloom's: Understand

*REFERENCES:* 2-2 The Chemistry of Cells

*LEARNING OBJECTIVES:* HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.

45. In both progeria and Werner syndrome, cells are switched from a growth to a maintenance mode, halting \_\_\_\_\_.

*ANSWER:* divisions  
cell divisions

*DIFFICULTY:* Bloom's: Remember

*REFERENCES:* 2-5 Mitosis Is Essential for Growth and Cell Replacement

*LEARNING OBJECTIVES:* HUHE.CUMM.16.2-5-1 - Discuss the importance of mitosis for growth and cell replacement and identify possible consequences when cell cycle regulation is interrupted.

46. Identical gene loci are located on \_\_\_\_\_.

*ANSWER:* homologous chromosomes  
homologues

*DIFFICULTY:* Bloom's: Understand

*REFERENCES:* 2-6 Cell Division by Meiosis: The Basis of Sex

*LEARNING OBJECTIVES:* HUHE.CUMM.16.2-6-2 - Illustrate the stages of meiosis I and meiosis II and describe what occurs at each stage.

47. The two types of nucleic acids are \_\_\_\_\_ and \_\_\_\_\_.

*ANSWER:* DNA; RNA  
RNA; DNA

*DIFFICULTY:* Bloom's: Understand

*REFERENCES:* 2-2 The Chemistry of Cells

*LEARNING OBJECTIVES:* HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.

48. There are two cellular domains: the \_\_\_\_\_ and the \_\_\_\_\_.

*ANSWER:* plasma membrane; cytoplasm  
cytoplasm; plasma membrane

*DIFFICULTY:* Bloom's: Understand

*REFERENCES:* 2-3 Cell Structure Reflects Function

*LEARNING OBJECTIVES:* HUHE.CUMM.16.2-3-2 - List the two cellular domains and give the major characteristics of each.

49. The three parts of interphase, in order, are \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_.

*ANSWER:* G1; S; G2

*DIFFICULTY:* Bloom's: Understand

*REFERENCES:* 2-4 The Cell Cycle Describes the Life History of a Cell

*LEARNING OBJECTIVES:* HUHE.CUMM.16. 2-4-2: - List the three stages of interphase and explain what occurs at each stage.

## **Chapter 02 - Cells and Cell Division**

50. Sister chromatids are joined by a common centromere and each carries identical \_\_\_\_\_.

**ANSWER:** genetic information  
genes

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-3 - Outline the four stages of mitosis and describe the characteristics of each stage.

### **Essay**

51. Describe the two ways in which meiosis produces new combinations of genes.

**ANSWER:** Random assortment of maternal and paternal chromosomes during cell division is the first way that meiosis produces new combinations of genes. In each pair of chromosomes, one copy was inherited from each parent. Random combinations of parental chromosomes arise in metaphase I when the maternal and paternal members of each pair line up at random with respect to all the other pairs. In other words, the arrangement of any chromosomal pair can be maternal:paternal or paternal:maternal. As a result, cells produced in meiosis I are much more likely to receive a *combination* of maternal and paternal chromosomes than they are to receive a complete set of maternal chromosomes or a complete set of paternal chromosomes.

Crossing over is the second way meiosis generates new combinations of genes. This process involves the physical exchange of parts between non-sister chromatids. Members of a chromosome pair carry identical genes but may carry different versions of those genes (alleles). For example, a chromosome may carry a gene for eye color. One copy of the chromosome may carry an allele for blue eyes, while the other carries an allele for brown eyes. The exchange of chromosome parts during crossing over creates new combinations of alleles inherited from each parent.

**DIFFICULTY:** Bloom's: Analyze

**REFERENCES:** 2-6 Cell Division by Meiosis: The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-6-3 - Explain the two processes of meiosis that create new combinations of genes.

52. Compare and contrast the events and results of oogenesis and spermatogenesis.

**ANSWER:** In males, the production of sperm, known as spermatogenesis, occurs in the testes. Cells called spermatogonia line the tubules of the testes and divide by mitosis from puberty until death, producing daughter cells called spermatocytes. Spermatocytes undergo meiosis, and the four haploid cells that result are called spermatids. Each spermatid develops into a mature sperm. The tubules within the testes contain many spermatocytes, and large numbers of sperm are always in production.

In females, the production of gametes is called oogenesis and takes place in the ovaries. Cells in the ovary known as oogonia begin mitosis early in embryonic development and finish a few weeks later. During meiosis I, one cell, destined to become the female gamete, receives about 95% of the cytoplasm and is called a secondary oocyte. The larger cell becomes the functional gamete (the ovum) and the nonfunctional, smaller cells are known as polar bodies. If the secondary oocyte is fertilized, meiosis II is completed quickly and the haploid nuclei of the ovum and sperm fuse to produce a diploid zygote.

**DIFFICULTY:** Bloom's: Analyze

**REFERENCES:** 2-7 Formation of Gametes

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-7-1 - Define the term gamete and outline the sequence of events leading

## **Chapter 02 - Cells and Cell Division**

to the formation of both male and female gametes.

53. Should the cost of treatment for a genetic disorder be an important consideration for insurance companies when deciding whether or not to cover the treatment? Justify your reasoning.

**ANSWER:** Answers will vary. One argument may be that insurance companies have to make decisions based on the best use of their available resources and that it would not be ethical, for example, to spend \$1,000,000 a year for any one patient's treatment when it might be possible to help hundreds or thousands of people with that same money.

Alternatively, one could argue that a dollar value cannot be placed on life. The cost of treatment for a person should not, in any way, come down to money. The purpose of medical insurance is to take care of people, no matter what the cost. By accepting premium payments from their clients, insurance companies are agreeing to cover the patient and that it should not matter how much that treatment costs.

**DIFFICULTY:** Bloom's: Evaluate

**REFERENCES:** 2-1 Cellular Links to Genetic Disease

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-1-1 - Describe an example of how cell structure and function are influenced by genetic information.

54. List the four macromolecules that make up cells and give a brief description of the structure and function of each.

**ANSWER:** Carbohydrates include small, water-soluble sugars and large polymers made of sugars. In the cell, carbohydrates have three important functions: They are structural components of cells; they act as energy sources for the cell; and, in combination with proteins on the surface, they give cells a molecular identity.

Lipids are a structurally and functionally diverse class of biological molecules partially defined by their insolubility in water. Lipids have many functions: They are structural components of membranes, some serve as energy reserves, while others act as hormones and vitamins. Lipids are classified into three major groups: fats and oils, phospholipids, and steroids. The phospholipids play important roles in the structure and function of the cell membrane.

Proteins are the most functionally diverse class of macromolecules. Proteins are polymers, made up of one or more chains of subunits, called amino acids. The varied structures of proteins are reflected in their diversity of functions.

Nucleic acids are polymers made from nucleotide subunits. Nucleotides themselves have important functions in energy transfer, but nucleic acids are the storehouses of genetic information in the cell. The information is encoded in the nucleotide sequence.

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-2 The Chemistry of Cells

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-2-1 - List the four classes of macromolecules that make up cells and explain how structure and function are interrelated in each.

55. Explain the structure and function of the cell nucleus. Include the terms nuclear envelope, nucleoli, chromatin, chromosomes, autosomes, and sex chromosomes.

**ANSWER:** The largest organelle is the nucleus. It is enclosed by a double membrane called the nuclear envelope. Within the nucleus, dense regions known as nucleoli synthesize ribosomes. Dark strands of chromatin are seen throughout the nucleus. As a cell prepares to divide, the

## **Chapter 02 - Cells and Cell Division**

chromatin condenses to form the chromosomes. In humans, there are 23 pairs of chromosomes (46 chromosomes) in most cells. Certain cells, such as sperm and eggs, carry only one copy of each chromosome and have 23 unpaired chromosomes. Human males have one pair of chromosomes that are not completely matched. Members of this pair are known as sex chromosomes. There are two types of human sex chromosomes: X and Y. Males carry an X chromosome and a Y chromosome, and females carry two X chromosomes. All other chromosomes are known as autosomes.

**DIFFICULTY:** Bloom's: Evaluate

**REFERENCES:** 2-3 Cell Structure Reflects Function

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-3-3 - Differentiate between the major cellular organelles and state their functions.

56. Briefly summarize the four phases of mitosis and cytokinesis.

**ANSWER:** Prophase: Chromosomes become visible as threadlike structures. As they continue to condense, they are seen as double structures, with sister chromatids joined at a single centromere.

Metaphase: Chromosomes become aligned at equator of cell.

Anaphase: Centromeres divide, and chromosomes move toward opposite poles.

Telophase: Chromosomes decondense; nuclear membrane forms.

Cytokinesis--Cleavage furrow gradually tightens and the cell eventually divides in two, distributing organelles to the daughter cells.

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-3 - Outline the four stages of mitosis and describe the characteristics of each stage.

57. Define interphase and describe its three stages.

**ANSWER:** Before cells can divide, they must grow to the size of the parental cell. Growth takes place during the first stage of interphase, the G1 stage. G1 begins immediately after division; during this stage, many cytoplasmic components, including organelles, membranes, and ribosomes, are made. G1 is followed by the S (synthesis) phase, during which a copy of each chromosome is made. A period known as G2 takes place before the cell is ready to begin a new round of division.

**DIFFICULTY:** Bloom's: Understand

**REFERENCES:** 2-4 The Cell Cycle Describes the Life History of a Cell

**LEARNING OBJECTIVES:** HUHE.CUMM.16. 2-4-2 - List the three stages of interphase and explain what occurs at each stage.

58. Some cells retain the capacity to divide throughout their life cycle, whereas others do not divide in adulthood. Give one example of each type.

**ANSWER:** Cells in bone marrow continually move through the cell cycle, producing about 2 million red blood cells each second.

Skin cells constantly divide to replace dead cells that are sloughed off the surface of the body.

Many cells in the nervous system leave the cell cycle, enter G0, and do not divide in adulthood.

**DIFFICULTY:** Bloom's: Apply

## Chapter 02 - Cells and Cell Division

**REFERENCES:** 2-5 Mitosis Is Essential for Growth and Cell Replacement

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-5-1 - Discuss the importance of mitosis for growth and cell replacement and identify possible consequences when cell cycle regulation is interrupted.

59. Explain the major difference between daughter cells formed by mitosis and those formed by meiosis. What occurs when two daughter cells formed during meiosis fuse?

**ANSWER:** In mitosis, each daughter cell receives two copies of each chromosome. Cells with two copies of each chromosome are diploid ( $2n$ ) and have 46 chromosomes. In meiosis, members of a chromosome pair separate from each other, and each daughter cell receives a haploid ( $n$ ) set of 23 chromosomes. These haploid cells form gametes (sperm and egg). Fusion of two haploid gametes in fertilization restores the chromosome number to the diploid number of 46, providing a full set of genetic information to the fertilized egg.

**DIFFICULTY:** Bloom's: Analyze

2-6 Cell Division by Meiosis: The Basis of Sex

**LEARNING OBJECTIVES:** HUHE.CUMM.16.2-4-3 - Outline the four stages of mitosis and describe the characteristics of each stage.

HUHE.CUMM.16.2-6-1 - Compare and contrast mitosis and meiosis.

Figure 2-1

60. All cells are fundamentally similar at a structural level. Using the accompanying diagram of a generalized human cell, name as many of the numbered labels as you can to illustrate this idea.

**ANSWER:** All cells have a plasma membrane, cytoplasm, membranous organelles, and a membrane-bound nucleus (see labeling below). All cells' shapes, internal organizations, and functions are under genetic control.

## Chapter 02 - Cells and Cell Division

**DIFFICULTY:** Bloom's: Understand
